

Dental Extraction

0 doses opioid + acetaminophen + ibuprofen + non-medication strategies

Recommendations from Recent Literature

- Nonsteroidal anti-inflammatory drugs (NSAIDs) and over-the-counter (OTC) pain medications are as effective as opioids at controlling pain after dental extraction.
- Most opioid prescriptions filled at the time of a dental procedure are not needed and go unused.
- Routine wisdom tooth extraction often exposes otherwise young and healthy patients to opioids for the first time, putting them at risk for opioid overdose and substance use disorder.
