PEDIATRICS

20+ best practice material kits assembled: Reached 7 MI counties

Preparing for surgery can be stressful, which is why OPEN strives to educate patients and healthcare providers on how to effectively manage postprocedural pain. OPEN maintains a library of provider and patient pain management education along with opioid prescribing recommendations. These procedure-specific recommendations are developed through data analysis using patient reported outcomes, literature review, and expert consensus. Recommendations are updated as new evidence is published.
